Grouping constructs delineate sub-expressions of a regular expression and capture substrings of an input string. The following table lists the grouping constructs –

Grouping construct	Description	Pattern	Matches
<i>subexpression</i>	Captures the matched subexpression and assigns it a zero-based ordinal number.	<code>\w\1</code>	"ee" in "deep"
<code>? &lt; name &gt; subexpression</code>	Captures the matched subexpression into a named group.	<code>? &lt; double &gt; \w\k&lt; double&gt;</code>	"ee" in "deep"
<code>? &lt; name1 – name2 &gt; subexpression</code>	Defines a balancing group definition.	<code>((?'Open'\([^\)]*)+('Close – Open'\([^\)]*)+)*?('Open?!')\$</code>	"(1 – 3*3 – 1)" in "3+2^(1 – 3*3 – 1)"
<code>? : subexpression</code>	Defines a noncapturing group.	Write? : Line?	"WriteLine" in "Console.WriteLine"
<code>?imnsx – imnsx : subexpression</code>	Applies or disables the specified options within subexpression.	<code>A\d{2}?i : \w+ \b</code>	"A12xl", "A12XL" in "A12xl A12XL a12xl"
<code>? = subexpression</code>	Zero-width positive lookahead assertion.	<code>\w+? = \.</code>	"is", "ran", and "out" in "He is. The dog ran. The sun is out."
<code>?!subexpression</code>	Zero-width negative lookahead assertion.	<code>\b?!un\w+\b</code>	"sure", "used" in "unsure sure unity used"
<code>? &lt;= subexpression</code>	Zero-width positive lookbehind assertion.	<code>? &lt;= 19\d{2}\b</code>	"99", "50", "05" in "1851 1999 1950 1905 2003"

<code>? &lt;!subexpression</code>	Zero-width negative lookbehind assertion.	<code>? &lt;!19\d{2}\b</code>	"51", "03" in "1851 1999 1950 1905 2003"
<code>? &gt; subexpression</code>	Nonbacktracking or "greedy" subexpression.	<code>[13579]? &gt; A + B+</code>	"1ABB", "3ABB", and "5AB" in "1ABB 3ABBC 5AB 5AC"
